## Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

## TDA9817; TDA9818

### FEATURES

- 5 V supply voltage
- Applicable for Intermediate Frequencies (IFs) of 38.9, 45.75 and 58.75 MHz
- Gain controlled wide band Video IF (VIF) amplifier (AC-coupled)
- True synchronous demodulation with active carrier regeneration (very linear demodulation, good intermodulation figures, reduced harmonics and excellent pulse response)
- Robustness for over-modulation better than 105% due to gated phase detector at L/L accent standard and PLL-bandwidth control at negative modulated standards
- Voltage Controlled Oscillator (VCO) frequency switchable between L and L accent (alignment external) picture carrier frequency
- VIF Automatic Gain Control (AGC) detector for gain control, operating as peak sync detector for B/G, peak white detector for L; signal controlled reaction time for L
- Tuner AGC with adjustable TakeOver Point (TOP)
- Automatic Frequency Control (AFC) detector without extra reference circuit

- AC-coupled limiter amplifier for sound intercarrier signal
- Alignment-free FM Phase-Locked Loop (PLL) demodulator with high linearity
- Sound IF (SIF) input for single reference Quasi Split Sound (QSS) mode (PLL controlled); SIF AGC detector for gain controlled SIF amplifier; single reference QSS mixer able to operate in high performance single reference QSS mode and in intercarrier mode
- AM demodulator without extra reference circuit
- Stabilizer circuit for ripple rejection and to achieve constant output signals
- ElectroStatic Discharge (ESD) protection for all pins.

### GENERAL DESCRIPTION

The TDA9817 is an integrated circuit for single standard vision IF signal processing and FM demodulation.

The TDA9818 is an integrated circuit for multistandard vision IF signal processing, sound AM and FM demodulation.

### ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
TDA9817T	SO24	plastic small outline package; 24 leads; body width 7.5 mm	SOT137-1
TDA9817TS	SSOP24	plastic shrink small outline package; 24 leads; body width 5.3 mm	SOT340-1
TDA9818	SDIP24	plastic shrink dual in-line package; 24 leads (400 mil)	SOT234-1
TDA9818T	SO24	plastic small outline package; 24 leads; body width 7.5 mm	SOT137-1
TDA9818TS	SSOP24	plastic shrink small outline package; 24 leads; body width 5.3 mm	SOT340-1

# Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

TDA9817; TDA9818

## Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

TDA9817; TDA9818

### FUNCTIONAL DESCRIPTION

The integrated circuit comprises the functional blocks as shown in Fig.1:

- Vision IF amplifier and VIF AGC detector
- Tuner AGC
- Frequency Phase Locked Loop detector (FPLL)
- VCO, Travelling Wave Divider (TWD) and AFC
- Video demodulator and amplifier
- Sound IF amplifier and SIF AGC
- Single reference QSS mixer
- AM demodulator
- FM-PLL demodulator
- Audio Frequency (AF) signal processing
- Internal voltage stabilizer.

#### Vision IF amplifier and VIF AGC detector

The vision IF amplifier consists of three AC-coupled differential amplifier stages. Each differential stage comprises a feedback network controlled by emitter degeneration.

The AGC detector generates the required VIF gain control voltage for constant video output by charging/discharging the AGC capacitor. Therefore for negative video modulation the sync level and for positive video modulation the peak white level of the video signal is detected. In order to reduce the reaction time for positive modulation, where a very large time constant is needed, an additional level detector increases the discharging current of the AGC capacitor (fast mode) in the event of a decreasing VIF amplitude step. The additional level information is given by the black-level detector voltage.

#### Tuner AGC

The AGC capacitor voltage is converted to an internal IF control signal, and is fed to the tuner AGC to generate the tuner AGC output current at pin TAGC (open-collector output). The tuner AGC takeover point can be adjusted at pin TADJ. This allows to match the tuner to the SAW filter in order to achieve the optimum IF input level.

#### Frequency Phase Locked Loop detector (FPLL)

The VIF-amplifier output signal is fed into a frequency detector and into a phase detector via a limiting amplifier. During acquisition the frequency detector produces a DC current proportional to the frequency difference between the input and the VCO signal. After frequency lock-in the phase detector produces a DC current

proportional to the phase difference between the VCO and the input signal. The DC current of either frequency detector or phase detector is converted into a DC voltage via the loop filter, which controls the VCO frequency. In the event of positive modulated signals the phase detector is gated by composite sync in order to avoid signal distortion for overmodulated VIF signals.

#### VCO, Travelling Wave Divider (TWD) and AFC

The VCO operates with a resonance circuit (with L and C in parallel) at double the picture carrier frequency. The VCO is controlled by two integrated variable capacitors. The control voltage required to tune the VCO from its free-running frequency to actually double the picture carrier frequency is generated by the frequency-phase detector (FPLL) and fed via the loop filter to the first variable capacitor. This control voltage is amplified and additionally converted into a current which represents the AFC output signal. At centre frequency the AFC output current is equal to zero.

For TDA9818: the VCO centre frequency can be decreased (required for L accent standard) by activating an additional internal capacitor. This is achieved by using the L accent switch. In this event the second variable capacitor can be controlled by a variable resistor at the L accent switch for setting the VCO centre frequency to the required L accent value.

The oscillator signal is divided by 2 with a TWD which generates two differential output signals with a 90 degree phase difference independent of the frequency.

#### Video demodulator and amplifier

The video demodulator is realized by a multiplier which is designed for low distortion and large bandwidth. The vision IF input signal is multiplied with the 'in phase' signal of the travelling wave divider output. In the demodulator stage the video signal polarity can be switched in accordance with the TV standard.

The demodulator output signal is fed via an integrated low-pass filter for attenuation of the carrier harmonics to the video amplifier. The video amplifier is realized by an operational amplifier with internal feedback and high bandwidth. A low-pass filter is integrated to achieve an attenuation of the carrier harmonics for B/G and L standard. The standard dependent level shift in this stage delivers the same sync level for positive and negative modulation. The video output signal at pin CVBS is 1.1 V (p-p) for nominal vision IF modulation, in order to achieve 1 V (p-p) at sound trap output.

## Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

TDA9817; TDA9818

### Sound IF amplifier and SIF AGC

The sound IF amplifier consists of two AC-coupled differential amplifier stages. Each differential stage comprises a controlled feedback network provided by emitter degeneration.

The SIF AGC detector is related to the SIF input signal (average level of AM or FM carrier) and controls the SIF amplifier to provide a constant SIF signal to the AM demodulator and single reference QSS mixer. At L standard (AM sound) the SIF AGC reaction time is set to 'slow' for nominal video conditions. But with a decreasing VIF amplitude step the SIF AGC is set to 'fast' mode controlled by the VIF AGC detector. In FM mode this reaction time is always 'fast'.

### Single reference QSS mixer

The single reference QSS mixer is realized by a multiplier. The SIF amplifier output signal is fed to the single reference QSS mixer and converted to intercarrier frequency by the regenerated picture carrier (VCO). The mixer output signal is fed via a high-pass for attenuation of the video signal components to the output pin QSS. With this system a high performance hi-fi stereo sound processing can be achieved.

For a simplified application without a sound IF SAW filter the single reference QSS mixer can be switched to the intercarrier mode by connecting pin SIF2 to ground. In this mode the sound IF passes the vision IF SAW filter and the composite IF signal is fed to the single reference QSS mixer. This IF signal is multiplied with the 90 degree TWD output signal for converting the sound IF to intercarrier frequency. This composite intercarrier signal is fed to the output pin QSS, too. By using this quadrature detection, the low frequency video signals are removed.

### AM demodulator

The AM demodulator is realized by a multiplier. The modulated SIF amplifier output signal is multiplied in phase with the limited (AM is removed) SIF amplifier output signal. The demodulator output signal is fed via an integrated low-pass filter for attenuation of the carrier harmonics to the AF amplifier.

### FM-PLL demodulator

The FM-PLL demodulator consists of a limiter and an FM-PLL. The limiter provides the amplification and limitation of the FM sound intercarrier signal. The result is high sensitivity and AM suppression. The amplifier consists of 7 stages which are internally AC-coupled in order to minimize the DC offset.

Furthermore the AF output signal can be muted by connecting a resistor between the limiter input pin FM<sub>in</sub> and ground.

The FM-PLL consists of an integrated relaxation oscillator, an integrated loop filter and a phase detector. The oscillator is locked to the FM intercarrier signal, output from the limiter. As a result of locking, the oscillator frequency tracks with the modulation of the input signal and the oscillator control voltage is superimposed by the AF voltage. The FM-PLL operates as an FM demodulator.

### Audio Frequency signal processing

The AF amplifier consists of two parts:

1. The AF pre-amplifier for FM sound is an operational amplifier with internal feedback, high gain and high common mode rejection. The AF voltage from the PLL demodulator, by principle a small output signal, is amplified by approximately 33 dB. The low-pass characteristic of the amplifier reduces the harmonics of the intercarrier signal at the sound output terminal pin V<sub>de-em</sub> at which the de-emphasis network for FM sound is applied. An additional DC control circuit is implemented to keep the DC level constant, independent of process spread.
2. The AF output amplifier (10 dB) provides the required output level by a rail-to-rail output stage. This amplifier makes use of an input selector for switching to AM, FM de-emphasis or mute state, controlled by the standard switching voltage and the mute switching voltage.

### Internal voltage stabilizer

The bandgap circuit internally generates a voltage of approximately 1.25 V, independent of supply voltage and temperature. A voltage regulator circuit, connected to this voltage, produces a constant voltage of 3.6 V which is used as an internal reference voltage.

## Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

TDA9817; TDA9818

### Notes

1. Values of video and sound parameters are decreased at  $V_P = 4.5$  V.
2. This parameter is not tested during production and is only given as an application information for designing the television receiver.
3. Loop bandwidth  $BL = 70$  kHz (natural frequency  $f_n = 12$  kHz; damping factor  $d \approx 3$ ; calculated with sync level within gain control range). Resonance circuit of VCO:  $Q_0 > 50$ ;  $C_{ext} = 8.2$  pF  $\pm 0.25$  pF;  $C_{int} \approx 8.5$  pF (loop voltage approximately 2.7 V).
4. Temperature coefficient of external LC circuit is equal to zero.
5.  $V_{i(VIF)(rms)} = 10$  mV;  $\Delta f = 1$  MHz (VCO frequency offset related to picture carrier frequency); white picture video modulation.
6. VIF signal for nominal video signal.
7. The leakage current of the AGC capacitor should not exceed 1  $\mu$ A at B/G standard, respectively 10 nA current at L standard. Larger currents will increase the tilt.
8. S/N is the ratio of black-to-white amplitude to the black level noise voltage (RMS value, pin CVBS).  $B = 5$  MHz weighted in accordance with "CCIR 567".
9. The intermodulation figures are defined:

$$\alpha_{1.1} = 20 \log\left(\frac{V_o \text{ at 4.4 MHz}}{V_o \text{ at 1.1 MHz}}\right) + 3.6 \text{ dB}; \alpha_{1.1} \text{ value at 1.1 MHz referenced to black/white signal;}$$

$$\alpha_{3.3} = 20 \log\left(\frac{V_o \text{ at 4.4 MHz}}{V_o \text{ at 3.3 MHz}}\right); \alpha_{3.3} \text{ value at 3.3 MHz referenced to colour carrier.}$$

10. Measurements taken with SAW filter K3953 (sound carrier suppression: 40 dB); loop bandwidth  $BL = 70$  kHz:
  - a) Modulation VSB; sound carrier off;  $f_{video} > 0.5$  MHz.
  - b) Sound carrier on; SIF SAW filter K9453;  $f_{video} = 10$  kHz to 10 MHz.
11. Response speed valid for a VIF input level range of 200  $\mu$ V up to 70 mV.
12. To match the AFC output signal to different tuning systems a current source output is provided. The test circuit is given in Fig.9. The AFC-steepness can be changed by the resistors at pin AFC.
13. Depending on the ratio  $\Delta C/C_0$  of the LC resonant circuit of VCO ( $Q_0 > 50$ ; note 3;  $C_0 = C_{int} + C_{ext}$ ).
14. Source impedance: 2.3 k $\Omega$  in parallel to 12 pF (SAW filter);  $f_F = 38.9$  MHz.
15. Without using an SIF SAW filter the mixer can be switched to intercarrier mode by connecting pin SIF1 and/or pin SIF2 to ground. In this mode the SIF passes the VIF SAW filter and IF intercarrier levels are depending on the sound shelf of the VIF SAW filter. The intercarrier output signal at pin QSS can be calculated by the following formula taking into account the video output signal at pin CVBS ( $V_{o(CVBS)(p-p)} = 1.1$  V typical) as a reference:

$$V_{o(rms)} = 1.1 \text{ V}(p-p) \times \frac{1}{2\sqrt{2}} \times 10^{\frac{V_{i(sc)}(dB) + 6 \text{ dB} \pm 3 \text{ dB}}{20}} \quad \text{where:}$$

- a)  $\frac{1}{2\sqrt{2}}$  = correction term for RMS value
- b)  $\frac{V_{i(sc)}}{V_{i(pc)}}(dB)$  = sound-to-picture carrier ratio at VIF inputs in dB
- c) 6 dB = correction term of internal circuitry
- d)  $\pm 3$  dB = tolerance of video output and intercarrier output amplitude  $V_{o(rms)}$

## Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

TDA9817; TDA9818

e) Example for SAW filter G1962: sound shelf value = 20 dB,

$$\frac{V_{i(sc)}}{V_{i(pc)}} = -27 \text{ dB} \Rightarrow V_{o(rms)} = 32 \text{ mV (typical value)}$$

16. Input level for second IF from an external generator with 50  $\Omega$  source impedance. AC-coupled with 10 nF capacitor,  $f_{mod} = 1 \text{ kHz}$ , 27 kHz (54% FM deviation) of audio references. A VIF/SIF input signal is not permitted. Pins  $C_{VAGC}$  and  $C_{SAGC}$  have to be connected to positive supply voltage for minimum IF gain. S/N and THD measurements are taken at 50  $\mu\text{s}$  de-emphasis at pin  $V_{de-em}$  (modulator pre-emphasis has to be activated). The FM demodulator steepness  $\Delta V_{o(AF)}/\Delta f_{AF}$  is positive.
  - a) Second IF input level 10 mV (RMS value).
17. Measured with an FM deviation of 27 kHz the typical AF output signal is 500 mV (RMS) ( $R_x = 0 \Omega$ ). By using  $R_x = 470 \Omega$  the AF output signal is attenuated by 6 dB [250 mV (RMS)]. For handling a frequency deviation of more than 53 kHz the AF output signal has to be reduced by using  $R_x$  in order to avoid clipping (THD < 1.5%). For an FM deviation up to 100 kHz an attenuation of 6 dB is recommended with  $R_x = 470 \Omega$ .
18. The leakage current of the decoupling capacitor (2.2  $\mu\text{F}$ ) should not exceed 1  $\mu\text{A}$ .
19. For all S/N measurements the used vision IF modulator has to meet the following specifications:
  - a) Incidental phase modulation for black-to-white jump less than 0.5 degrees
  - b) QSS AF performance, measured with the television demodulator AMF2 (audio output, weighted S/N ratio) better than 60 dB (deviation 27 kHz) for 6 kHz sine wave black-to-white video modulation
  - c) Picture-to-sound carrier ratio;  $pc/sc1 = 13 \text{ dB}$  (transmitter).
20. The  $pc/sc1$  ratio is calculated as the addition of TV transmitter  $pc/sc1$  ratio and SAW filter  $pc/sc1$  ratio. This  $pc/sc1$  ratio is necessary to achieve the  $S/N_W$  values as noted. A different  $pc/sc1$  ratio will change these values.
21. Measurements taken with SAW filter K3953 for vision IF (suppressed sound carrier) and K9453 for sound IF (suppressed picture carrier). Input level  $V_{i(SIF)(rms)} = 10 \text{ mV}$ , 27 kHz (54% FM deviation).
22. Measurements taken with SAW filter G1962 (sound shelf: 20 dB) for vision and sound IF. Pin SIF1 and/or pin SIF2 has to be connected to ground for switching the single reference QSS mixer to intercarrier mode.
23. Measurements taken with SAW filter K9453 (Siemens) for AM sound IF (suppressed picture carrier).

## TDA9817; TDA9818

### SOLDERING

#### Introduction

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398 652 90011).

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mount components are mixed on one printed-circuit board. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

#### Through-hole mount packages

##### SOLDERING BY DIPPING OR BY SOLDER WAVE

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg(max)}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

##### MANUAL SOLDERING

Apply the soldering iron (24 V or less) to the lead(s) of the package, either below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

#### Surface mount packages

##### REFLOW SOLDERING

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor

type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
  - for all the BGA, HTSSON..T and SSOP-T packages
  - for packages with a thickness  $\geq 2.5$  mm
  - for packages with a thickness  $< 2.5$  mm and a volume  $\geq 350$  mm<sup>3</sup> so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness  $< 2.5$  mm and a volume  $< 350$  mm<sup>3</sup> so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

##### WAVE SOLDERING

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

---

## Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

---

## TDA9817; TDA9818

---

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

### MANUAL SOLDERING

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

## Suitability of IC packages for wave, reflow and dipping soldering methods

MOUNTING	PACKAGE <sup>(1)</sup>	SOLDERING METHOD		
		WAVE	REFLOW <sup>(2)</sup>	DIPPING
Through-hole mount	CPGA, HCPGA	suitable	–	suitable
	DBS, DIP, HDIP, RDBS, SDIP, SIL	suitable <sup>(3)</sup>	–	–
Through-hole-surface mount	PMFP <sup>(4)</sup>	not suitable	not suitable	–
Surface mount	BGA, HTSSON..T <sup>(5)</sup> , LBGA, LFBGA, SQFP, SSOP-T <sup>(5)</sup> , TFBGA, USON, VFBGA	not suitable	suitable	–
	DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable <sup>(6)</sup>	suitable	–
	PLCC <sup>(7)</sup> , SO, SOJ	suitable	suitable	–
	LQFP, QFP, TQFP	not recommended <sup>(7)(8)</sup>	suitable	–
	SSOP, TSSOP, VSO, VSSOP	not recommended <sup>(9)</sup>	suitable	–
	CWQCCN..L <sup>(11)</sup> , PMFP <sup>(10)</sup> , WQCCN32L <sup>(11)</sup>	not suitable	not suitable	–

### Notes

- For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
- For SDIP packages, the longitudinal axis must be parallel to the transport direction of the printed-circuit board.
- Hot bar soldering or manual soldering is suitable for PMFP packages.
- These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding  $217\text{ °C} \pm 10\text{ °C}$  measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- If wave soldering is considered, then the package must be placed at a  $45^\circ$  angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- Hot bar or manual soldering is suitable for PMFP packages.
- Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.

## DATA SHEET STATUS

LEVEL	DATA SHEET STATUS <sup>(1)</sup>	PRODUCT STATUS <sup>(2)(3)</sup>	DEFINITION
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

### Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
3. For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

### DEFINITIONS

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

**Limiting values definition** — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

### DISCLAIMERS

**Life support applications** — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

**Right to make changes** — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
